Excel allows you to enter many things into a cell, including times. This leads some people to use Excel to help calculate elapsed times. For instance, you may have a column that contains a starting time, another that contains an ending time, and then use a third column to calculate the time between the beginning and ending time.

Most of the presented solutions use Application.Wait, which does not take in account the time (miliseconds) already elapsed since the current second count started, so they have an intrinsic imprecision of up to 1 second.. The Timer approach is the best solution, but you have to take in account the reset at midnight, so here is a very precise Sleep method using Timer:
