Amount - Introduction. The amount of a substance is a measure of the number of particles of a substance, be they individual atoms, as with the noble gases, diatomic molecules, such as with oxygen and the halogens, or more complex molecules.. Since atoms are so small and weigh so little even 1 g of a compound will contain an uncountable number of particles.

Things are a bit different when you need to find the volume, pressure, or temperature of a gas not at STP. You will need to solve  $PV = nRT$  for the dimension you need to find and attach it to the end of the sequence using the roadmap to find 'n' for the gas. Let's take another problem based on the same chemical equation to explore how to set up finding a gas not at STP.

Equilibrium Constant Expressions. Reactions don't stop when they come to equilibrium. But the forward and reverse reactions are in balance at equilibrium, so there is no net change in the concentrations of the reactants or products, and the reaction appears to stop on the macroscopic scale.
