Solution First suppose $p(z)$ is the zero polynomial. (So, the degree of $p(z)$ is $-\infty$.) The degree of $r(z)$ must be less than the degree of $q(z)$. If $h(z) \neq 0$, it follows that the degree of $h(z)q(z)$ is greater than the degree of $r(z)$. This then implies that $h(z)q(z) + r(z) \neq 0$.

Some of the exercises are "undoable," a fact which became apparent to me in the course of preparing a solution manual. For instance, Exercises XV.4-5 on pp.405-406 are correct but undoable on the basis of the treatment in the book. Substitute exercises are provided in the list of changes.

Complex analysis was made, in part, to compute definite and indefinite integrals. So having a book that does not teach you how to use the residue theorem to compute an integral is doing you a disservice. This is another reason why books like Rudin's Real and Complex Analysis are not good first choices for textbooks.
