Exponential decay is generally applied to word problems that involve financial applications as well as those that deal with radioactive decay, medicine dosages, and population decline. To decay exponentially means that the topic being studied is decreasing in proportion to the amount that was previously present. The following is an example of an exponential decay problem.

Problems concerning horizontal asymptotes appear on both the AP Calculus AB and BC exam, and it's important to know how to find horizontal asymptotes both graphically (from the graph itself) and analytically (from the equation for a function).. Before we delve into finding the asymptotes though we better see what exactly an asymptote is.

In computer science, the time complexity is the computational complexity that describes the amount of time it takes to run an algorithm. Time complexity is commonly estimated by counting the number of elementary operations performed by the algorithm, supposing that each elementary operation takes a fixed amount of time to perform.

Exponentiation is a mathematical operation, written as b^n , involving two numbers, the base b and the exponent or power n . When n is a positive integer, exponentiation corresponds to repeated multiplication of the base: that is, b^n is the product of multiplying n bases: $= \times \cdots \times \square$. The exponent is usually shown as a superscript to the right of the base. In that case, b^n is called "b ...

An analysis of the history of technology shows that technological change is exponential, contrary to the common-sense intuitive linear view. So we won't experience 100 years of progress in the 21st century -- it will be more like 20,000 years of progress (at today's rate). The returns, such as chip speed and cost-effectiveness, also increase exponentially.

The numbers get bigger and converge around 2.718. Hey... wait a minute... that looks like e! Yowza. In geeky math terms, e is defined to be that rate of growth if we continually compound 100% return on smaller and smaller time periods:. This limit appears to converge, and there are proofs to that effect. But as you can see, as we take finer time periods the total return stays around 2.718.

An irrational number is a number that cannot be expressed as a fraction p/q for any integers p and q . Irrational numbers have decimal expansions that neither terminate nor become periodic. Every transcendental number is irrational. There is no standard notation for the set of irrational numbers, but the notations \mathbb{Q}^c , $\mathbb{R} \setminus \mathbb{Q}$, or $\mathbb{R} \backslash \mathbb{Q}$, where the bar, minus sign, or backslash indicates the set ...
