In number theory and combinatorics, a partition of a positive integer  $n$ , also called an integer partition, is a way of writing  $n$  as a sum of positive integers. Two sums that differ only in the order of their summands are considered the same partition. (If order matters, the sum becomes a composition.) For example, 4 can be partitioned in five distinct ways:

A rational triangle is a triangle with sides of rational lengths. In this short note, we prove that there exists a unique pair of a rational right triangle and a rational isosceles triangle which have the same perimeter and the same area.

as can be seen in the above diagram, in which the  $s$ th triangular number is represented by the white triangles, the  $t$ th triangular number is represented by the black triangles, and the total number of triangles is the square number (R. Sobel, pers. comm.).. Square numbers can also be generated by taking the product of two consecutive even or odd numbers and adding 1.
