Consider a cantilever beam, with length L , height $2a$ and out-of-plane thickness b , as shown in the figure. The beam is made from an isotropic linear elastic solid with Young's modulus and Poisson ratio. The top and bottom of the beam are traction free, the left hand end is subjected to a resultant force P , and the right hand end is clamped.

The generalized force for dislocation motion is defined as follows. Consider an elastic solid, which contains a dislocation loop. The loop is characterized by a curve C , the tangent vector, and the burgers vector b . As usual, we can imagine creating the dislocation loop by cutting the crystal over some surface S that is bounded by C , and displacing the two material surfaces adjacent to the cut ...

Poromechanics is a branch of physics and specifically continuum mechanics and acoustics that studies the behaviour of fluid-saturated porous media. A porous medium or a porous material is a solid (often called matrix) permeated by an interconnected network of pores (voids) filled with a fluid (liquid or gas). Usually both solid matrix and the pore network (also known as the pore space) are ...
