Practice problems that illustrate the difference between codominance and incomplete dominance. Students are given traits to determine what type of inheritance is occurring and perform genetic crosses using punnett squares.

Genetics: Codominance & Incomplete Dominance

Dominance in genetics is a relationship between alleles of one gene, in which the effect on phenotype of one allele masks the contribution of a second allele at the same locus. The first allele is dominant and the second allele is recessive. For genes on an autosome (any chromosome other than a sex chromosome), the alleles and their associated traits are autosomal dominant or autosomal recessive.

Main Difference - Codominance vs Incomplete Dominance. According to Mendel, the phenotype of the offspring always resembles the parents. On that account, the phenotype of the offspring is determined by the number of dominant and recessive alleles for a particular trait. But, the interactions between different alleles determining a particular trait complicate the Mendelian inheritance.

Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in organisms.. Gregor Mendel, a scientist and Augustinian friar, discovered genetics in the late 19th-century. Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring. He observed that organisms (pea plants) inherit traits by way of discrete "units ...
