The human genome is the complete set of nucleic acid sequences for humans, encoded as DNA within the 23 chromosome pairs in cell nuclei and in a small DNA molecule found within individual mitochondria. These are usually treated separately as the nuclear genome, and the mitochondrial genome. Human genomes include both protein-coding DNA genes and noncoding DNA.

A genome sequence is the complete list of the nucleotides (A, C, G, and T for DNA genomes) that make up all the chromosomes of an individual or a species. Within a species, the vast majority of nucleotides are identical between individuals, but sequencing multiple individuals is necessary to understand the genetic diversity.

In this update of Enrichr we report that we submitted the Enrichr API to SmartAPI so Enrichr can be integrated with other tools and products of the NIH Data Commons. This release of Enrichr contains new reference genomes, human (hg 19 and hg38) and mouse (mm9 and mm10), for the BED-file conversion and upload.
