During the formation of a solution, collisions occur between particles of the solute and solvent. Factors that affect the rate of dissolving include surface area, stirring, and temperature. Solutions are described as saturated, unsaturated, or supersaturated, depending on the amount of solute in solution.

Having a negative ΔH_{soln} is one factor that favors formation of solutions. However, many solutions are known to form spontaneously when ΔH_{soln} is zero or even positive. Another factor must also be involved in determining whether a solution will form. That factor is disorder or entropy. Examine your three pictures on page 1 of this handout.
