In computing, a Control key is a modifier key which, when pressed in conjunction with another key, performs a special operation (for example, Ctrl+C); similar to the Shift key, the Control key rarely performs any function when pressed by itself. The Control key is located on or near the bottom left side of most keyboards (in accordance with the international standard ISO/IEC 9995-2), with many ...

It refers to lambda calculus, which is a formal system that just has lambda expressions, which represent a function that takes a function for its sole argument and returns a function. All functions in the lambda calculus are of that type, i.e.,  $\lambda : \lambda \rightarrow \lambda$ . Lisp used the lambda concept to name its anonymous function literals.

Despite the (formerly) accepted answer to this question, the bang is not in fact a member or collection access operator. It does one simple and specific thing: The bang operator provides late-bound access to the default member of an object, by passing the literal name following the bang operator as a string argument to that default member. That's it.

History. Although the Greeks examined limiting process, such as the Babylonian method, they probably had no concept similar to the modern limit. The need for the concept of a limit came into force in the 17th century when Pierre de Fermat attempted to find the slope of the tangent line at a point of a function such as  $f(x) = x^2$ . Using a non-zero, but almost zero quantity,  $h$ , Fermat performed the ...

Definition 1: Suppose a random variable  $x$  has a frequency function  $f(x; \theta)$  that depends on parameters  $\theta = \{\theta_1, \theta_2, \dots, \theta_k\}$ . For a sample  $\{x_1, x_2, \dots, x_n\}$  the likelihood function is defined by Here we treat  $x_1, x_2, \dots, x_n$  as fixed. The maximum likelihood estimator of  $\theta$  is the value of  $\theta$  that maximizes  $L(\theta)$ . We can then view the maximum likelihood estimator of  $\theta$  as a function ...
