The geometry of a base, or base pair step can be characterized by 6 coordinates: shift, slide, rise, tilt, roll, and twist. These values precisely define the location and orientation in space of every base or base pair in a nucleic acid molecule relative to its predecessor along the axis of the helix.

Nucleic acid double helix - Wikipedia

DNA is a long polymer made from repeating units called nucleotides. The structure of DNA is dynamic along its length, being capable of coiling into tight loops and other shapes. In all species it is composed of two helical chains, bound to each other by hydrogen bonds. Both chains are coiled around the same axis, and have the same pitch of 34 angstroms (Å) (3.4 nanometres).

A simplified potential diagram of a generalized (bio)chemical sensor is shown in Fig. 2, which conveys the necessary information required to understand the basic detection principle. Shoorideh and Chui (2014). The observed responses originate from charge σ_0 resting at the sensing surface. This charge sees capacitances on both of its sides with signal grounds that follow.
