Electrical Transient In Power Systems

Electrical transient is defined as momentary bursts of energy that are induced upon power, data, or communication lines. They are characterized by extremely high voltages that can drive tremendous amounts of current into an electrical circuit.

What is transient in electrical power systems? - Quora

One of the causes of the creation of such transients is that of Lightning. Their mode of action is usually indirect and exerts it through affecting the power line. They generate induced transients by coupling into the power system. Another cause is that of the routine utility tasks which include: Facility load switches
