The operation of a hot air balloon depends on Charles' Law, the Ideal Gas Law, and Archimedes' Principle. The operator first ignites a propane burner to fill the balloon with air. As the air continues to heat up, it expands, according to Charles' Law: $V \propto KT$. The balloon has a fixed volume, so the extra volume flows out of the hole in the bottom of the balloon.

During the seventeenth and especially eighteenth centuries, driven both by a desire to understand nature and a quest to make balloons in which they could fly (), a number of scientists established the relationships between the macroscopic physical properties of gases, that is, pressure, volume, temperature, and amount of gas. Although their measurements were not precise by today's standards ...

In statistical mechanics, entropy is an extensive property of a thermodynamic system. It is closely related to the number Ω of microscopic configurations (known as microstates) that are consistent with the macroscopic quantities that characterize the system (such as its volume, pressure and temperature). Under the assumption that each microstate is equally probable, the entropy is the natural ...

Coulomb's inverse square law translates into the local differential property of the field expressed by Gauss, namely: $\text{div } \mathbf{E} = \rho/\epsilon_0$. The SI unit of electric charge is named after the French military engineer Charles Augustin de Coulomb (1736-1806). Using a torsion balance, Coulomb discovered, in 1785, that the ...
