Evaluation of the Ideal Gas Law Constant Lab Background, Theory, and Objectives When dealing with gases, there are theories and laws about "ideal" gases that can be used to calculate different pressures, volumes, temperatures, etc. One such law is Boyle's Law which states  $V_1 P_1 = V_2 P_2$ . Another law is Charles's Law that states  $V_1 \dots$

1 Evaluation of the Gas Law Constant Purpose: To determine the value of the Gas Law Constant,  $R$ , using the ideal gas law,  $PV=nRT$  Background: To be able to determine the gas law constant,  $R$ , the values of  $P$ ,  $V$ ,  $n$ , and  $T$  must be available. The experiment is based on the reaction between magnesium metal and hydrochloric acid to

### Evaluation of the Gas Law Constant-final

The presentation of the ideal gas law  $PV = nRT$  can be found in your textbook. This law will be used in this experiment to evaluate  $R$ , the gas law constant. If  $R$  is to be determined, the other parameters  $P$ ,  $V$ ,  $n$  and  $T$  in the equation must be available from the experiment, that is, it must be possible to measure them in the laboratory.

The Ideal Gas Law describes the relationship between pressure, volume, the number of atoms or molecules in a gas, and the temperature of a gas. This law is an idealization because it assumes an "ideal" gas. An ideal gas consists of atoms or molecules that do not interact and that occupy zero volume. A real

The ideal gas law, also called the general gas equation, is the equation of state of a hypothetical ideal gas. It is a good approximation of the behavior of many gases under many conditions, although it has several limitations. It was first stated by Émile Clapeyron in 1834 as a combination of the empirical Boyle's law, Charles's law, Avogadro's law, and Gay-Lussac's law.
