yet another very poorly worded question, as you can tell by the variety of answers. Better would be "which does not use electrical power" for which the answer is none, they all do. The possible exception is battery, if it is NOT a rechargeable one. The battery supplies electric power as opposed to using it.

Answer: See answers below. Like the previous question, this question tests your understanding of the mathematical relationship between power, current, voltage and resistance. But this question also tests your understanding between power, time, energy and electricity costs. An electric bill is based upon energy consumption.

A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power. $P = VI = (120 \text{ V})(15 \text{ A}) = 1,800 \text{ W}$. Total power in a parallel circuit is the sum of the power consumed on the individual branches.
