How can I define the frequency resolution in FFT? And what ...

Frequency Resolution The frequency resolution of a spectrum-analysis window is determined by its main-lobe width (Chapter 3) in the frequency domain, where a typical main lobe is illustrated in Fig.5.6 (top). For maximum frequency resolution, we desire the narrowest possible main-lobe width, which calls for the rectangular window (§3.1), the transform of which is shown in Fig.3.3.

The term "resolution" has multiple meanings. In optics, two lines are resolved only if you can see a gap between them. In graphics, resolution might be related to plot points per inch (or other linear measure).

You have the option to process only part of a song or skip finding notes and just generate a spectrogram display. You can also increase the frequency resolution and/or decrease the time step if you want a higher resolution image. A higher resolution image will take longer to generate, but doesn't affect the automatic note detection accuracy.

Short answer. Assume that the signal is sampled (at least) by the Nyquist frequency, the number of samples is N and that the sampling time is T_0 seconds. Then the sampling interval is $T = T_0 / N$. Then you'll have frequencies ranging in $1/T_0$, ...

How does the sampling rate influence the frequency ...

A logical approach to setting up an FFT starts at setting the frequency resolution, Δf . This parameter

is the spacing of samples in the frequency domain display and is similar to the resolution bandwidth setting in an RF spectrum analyzer. The Δf is set by the time duration of the time domain signal being input to the FFT.

Review the settings. These settings may include (depending on your scanner model) color management for fine-tuning the way colors are scanned and resolution settings that control how detailed a scan is performed. (The higher the resolution, the crisper and cleaner your electronic document, but the more time it may take to scan.)

Then, the desirable time resolution for the central frequency should be defined. For example, we may wish to have a temporal resolution of 3 seconds at frequency 1 Hz (default parameters). These two parameters, uniquely define the temporal and spectral resolution of the wavelet for all other frequencies, as shown in the plots below.
