Vibration is a mechanical phenomenon whereby oscillations occur about an equilibrium point. The word comes from Latin vibrationem ("shaking, brandishing"). The oscillations may be periodic, such as the motion of a pendulum—or random, such as the movement of a tire on a gravel road.. Vibration can be desirable: for example, the motion of a tuning fork, the reed in a woodwind instrument or ...

A simple example of harmonic motion is a mass connected to a flexible cantilevered beam. External force, either from a one-time impulse or from a periodic force such as vibration, will cause the system to resonate as the spring alternately stores and imparts energy to the moving mass.

1. Introduction and Historical Overview. Near Infrared Spectroscopy (NIR) is a type of vibrational spectroscopy that employs photon energy ($h\nu$) in the energy range of 2.65×10^{-19} to 7.96×10^{-20} J, which corresponds to the wavelength range of 750 to 2,500 nm (wavenumbers: 13,300 to 4,000 cm^{-1}). This energy range is higher than necessary to promote molecules only to their lowest excited ...

The Restoring Force. A vibrating bobblehead often does the back and forth a number of times. The vibrations repeat themselves over and over. As such, the bobblehead will move back to (and past) the equilibrium position every time it returns from its maximum displacement to the right or the left (or above or below).
