The numbers get bigger and converge around 2.718. Hey... wait a minute... that looks like e ! Yowza. In geeky math terms, e is defined to be that rate of growth if we continually compound 100% return on smaller and smaller time periods. This limit appears to converge, and there are proofs to that effect. But as you can see, as we take finer time periods the total return stays around 2.718.

One very important exponential equation is the compound-interest formula: ...where "A" is the ending amount, "P" is the beginning amount (or "principal"), "r" is the interest rate (expressed as a decimal), "n" is the number of compoundings a year, and "t" is the total number of years. Regarding the variables, n refers to the number of compoundings in any one year, not to the total number of ...

Problems concerning horizontal asymptotes appear on both the AP Calculus AB and BC exam, and it's important to know how to find horizontal asymptotes both graphically (from the graph itself)

and analytically (from the equation for a function).. Before we delve into finding the asymptotes though we better see what exactly an asymptote is.

Euler's formula, named after Leonhard Euler, is a mathematical formula in complex analysis that establishes the fundamental relationship between the trigonometric functions and the complex exponential function. Euler's formula states that for any real number x : $e^{ix} = \cos x + i \sin x$, where e is the base of the natural logarithm, i is the imaginary unit, and \cos and \sin are the trigonometric functions ...
