Examples. When an object's velocity is held constant at one meter per second against a constant opposing force of one newton, the rate at which work is done is 1 watt. $= = \cdot = \cdot$ In terms of electromagnetism, one watt is the rate at which electrical work is performed when a current of one ampere (A) flows across an electrical potential difference of one volt (V).

Watt - Wikipedia

Whenever an electric current flows through a material that has some resistance (i.e., anything but a superconductor), it creates heat. This resistive heating is the result of "friction," as created by microscopic phenomena such as retarding forces and collisions involving the charge carriers (usually electrons); in formal terminology, the heat corresponds to the work done by the charge ...

Resistive heating explained in details

The history of hydraulic systems can be traced back to the 1646, when Braise Pascal performed the first hydrostatic experiment. He used a Pascal's barrel to investigate the effect of a force applied at one point of the fluid and how it is transmitted to the other sections within an enclosed system. The outcome of his experiments resulted in a scientific law/principle called Pascal Law or ...
