The study of a family in which the Opitz syndrome segregated with an X-chromosome inversion permitted Quaderi et al. (1997) to refine the position of the disease locus on Xp22, which they referred to as OSX (for Opitz syndrome, X-linked). By use of a positional cloning strategy within the OSX critical region, Quaderi et al. (1997) identified a novel gene, designated MID1 (midline-1), containing ...
