The lab handout is attached below in both Word and PDF format. (Note: Hat tip to Mr. Tony Locke, who shared this lab with an IB workshop I attended. I have modified it some along the way.) The lab is a pretty basic look at causing disruptions to an equilibrium and making predictions - and then observations - based on Le Châtelier's Principle.

In order to calculate the equilibrium constant, one must simultaneously determine the concentrations of all three of the components. In this experiment, you will measure the concentration of FeSCN^{2+} at equilibrium by measuring its absorbance at 470 nm. Since Fe^{3+} and SCN^- do not absorb light at this wavelength, they do not interfere with the measurements.
