A crystal oscillator is an electronic oscillator circuit that uses a piezoelectric resonator, a crystal, as its frequency-determining element. Crystal is the common term used in electronics for the frequency-determining component, a wafer of quartz crystal or ceramic with electrodes connected to it. A more accurate term for it is piezoelectric resonator.

A tuning fork is a fork-shaped acoustic resonator used in many applications to produce a fixed tone. The main reason for using the fork shape is that, unlike many other types of resonators, it produces a very pure tone, with most of the vibrational energy at the fundamental frequency. The reason for this is that the frequency of the first overtone is about $5 \frac{2}{22} = 25 \frac{1}{4} = 6 \frac{1}{4}$ times ...

The major challenge of both EF and PEF is that both processes are only optimum at strong acidic pH conditions (i.e. pH 2.8–3.5), which are negative and disadvantageous from the environmental point of view, since a final neutralization step may become necessary to obtain tolerable effluents [, , ,]. Besides, efficiency of EF and PEF significantly reduced when working outside pH 2.8–3.5.
