The answer is not the arithmetic mean (3%) because each raise is a percentage of a different salary. I thought the average raise would be the GEOMETRIC mean (.0191293118 = 1.91293118%), but that doesn't work out either. I picked a random starting salary to check my work. I used \$40,000 as an example.

Geometric Mean. The Geometric Mean is a special type of average where we multiply the numbers together and then take a square root (for two numbers), cube root (for three numbers) etc. First we multiply them: $2 \times 18 = 36$. Then (as there are two numbers) take the square root: $\sqrt{36} = 6$.

The geometric mean is the average growth of an investment computed by multiplying n variables and then taking the n square root. In other words, it is the average return of an investment over time, a metric used to evaluate the performance of an investment portfolio. The geometric mean formula can be broken down to show

Geometric Mean - How to Calculate, and Why to Use

The answer is the geometric mean. If you calculate this geometric mean you get approximately 1.283, so the average rate of return is about 28% (not 30% which is what the arithmetic mean of 10%, 60%, and 20% would give you). Any time you have a number of factors contributing to a product, and you want to find the "average" factor, the answer is ...

Question Corner -- Applications of the Geometric Mean

To calculate the geometric mean of 2 numbers, multiply those 2 numbers together, then calculate the square root of the resulting product. If you have 3 or more numbers, multiply all of the numbers together, then raise them to the power of 1 divided by n, where n is the total number of entries in the data set.
