In physics, the Navier–Stokes equations (/ n æ v ' j eɪ s t oʊ k s /), named after Claude-Louis Navier and George Gabriel Stokes, describe the motion of viscous fluid substances.. These balance equations arise from applying Isaac Newton's second law to fluid motion, together with the assumption that the stress in the fluid is the sum of a diffusing viscous term (proportional to the ...

The Reynolds number (Re) is an important dimensionless quantity in fluid mechanics used to help predict flow patterns in different fluid flow situations. At low Reynolds numbers, flows tend to be dominated by laminar (sheet-like) flow, while at high Reynolds numbers turbulence results from differences in the fluid's speed and direction, which may sometimes intersect or even move counter to the ...

Las ecuaciones de Navier-Stokes reciben su nombre de Claude-Louis Navier y George Gabriel Stokes.Se trata de un conjunto de ecuaciones en derivadas parciales no lineales que describen el movimiento de un fluido.Estas ecuaciones gobiernan la atmósfera terrestre, las corrientes oceánicas y el flujo alrededor de vehículos o proyectiles y, en general, cualquier fenómeno en el que se involucren ...
